

1. I decided to make a visualization of the Lorentz Attractor. I unfortunately didn't have much time to work on it because the past few days were the only times when a friend in a different class was available to work on our project in that class. I'm still extremely happy about the visuals. I tried to include a trail system but I was struggling getting gulls to do that and didn't have time to use raw WebGPU. I didn't include any controls because there aren't a lot of things to include. Something extremely cool is that since I used the particles z coordinate to control its size and shift its location. This creates a very visible 3d illusion so you can get the 3d structure of the attractor.

The person I showed it to agreed that it definitely gets the visuals of the attractor across. The 3d structure is conveyed. They felt I got the visuals I was aiming for. They did feel like the visuals were fine. The way that the blueness oscillates is a bit weird but they felt it was fine.
