

1. I started with the same ant sim that the example had, then added different drawing colours for the two different types of ants. Then I made new pheromone states and rendering logic for them and made the way that the two species of ants turn on those new pheromones different (because that was the only way I could really make it visually interesting).

For the new behaviours I made the pheromone changes go in a loop (eg. with 3 pheromones 0 -> 1 -> 2 -> 0). And for the first new behaviour I made the first type of ants not turn on the new pheromone, and the second species turning -90 degrees. And for the second new behaviour I added two pheromones. For the first, again, species 1 didn't turn, but species 2 turned 90 degrees. For the second new pheromone, species 2 didn't turn but species 1 turned 90 degrees.
